PROFOUNDERS CAPITAL · BUSINESS ANALYST & AI AUTOMATION · PRE-READ

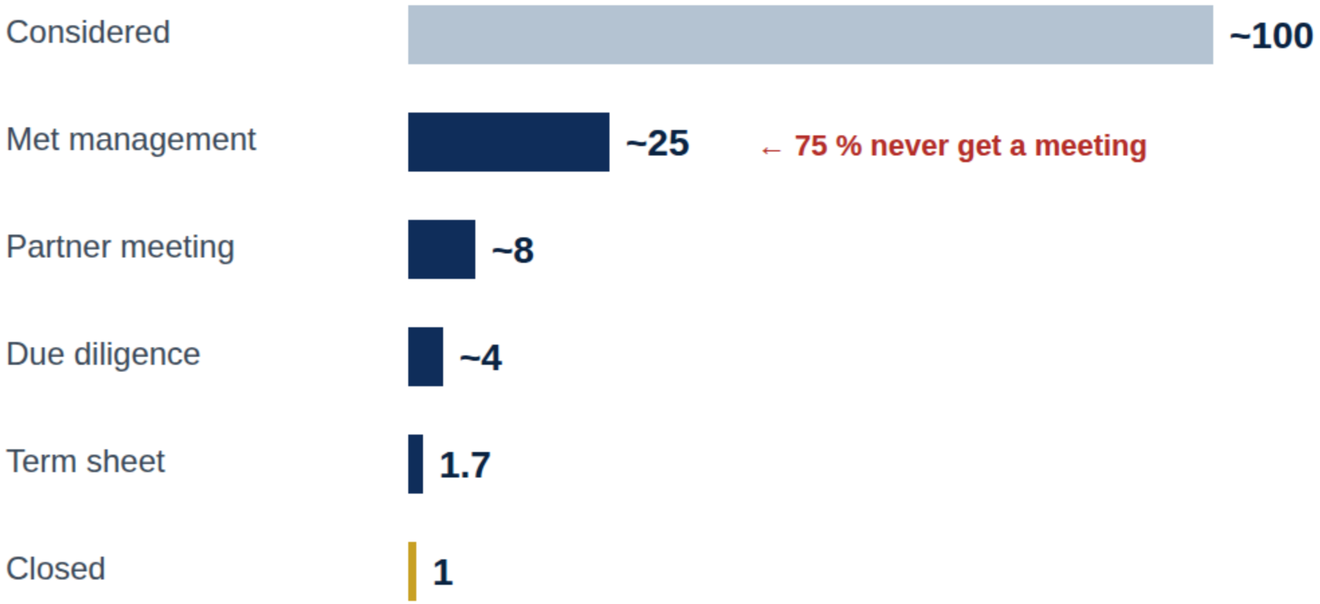

"We back the fixers." Here is the operating system that finds them faster, starting where your ground truth already exists: screening

You meet thousands of companies a year and back six to eight. How I would build the sourcing, screening, diligence and monitoring system, deploy it inside your stack, and prove it in thirty days on decisions you have already made.

Roland-Caryl Obam · September 2026

A fund screens about a hundred opportunities per deal closed; you meet thousands and back six to eight, so your past decisions are the fund's most valuable dataset

OPPORTUNITIES PER CLOSED DEAL, SURVEY OF 885 VCS (APPROXIMATE MEDIANS)

118 h

of due diligence per closed deal, on average

83 days

from first look to close

6 to 8

investments a year, out of thousands of companies met (your website)

Three quarters of the work is deciding what not to meet. Each of those decisions carries a label in your CRM: the one dataset the fund already owns, and the one this system learns from and is judged against.

Sources: Gompers, Gornall, Kaplan, Strebulaev, "How Do Venture Capitalists Make Decisions?", JFE 2020 (NBER w22587), fractions rounded; "thousands" and "6 to 8": profounderscapital.com

Deal volume is not the constraint; the cost and consistency of screening and monitoring are, and both already have data you own

STAGE	WHAT THE WORK IS	GROUND TRUTH YOU ALREADY HOLD	AUTOMATE NOW	ORDER
Sourcing	Finding companies before others do: events, referrals, scraping, outbound	Weak: the signal is outside the fund	◔ assist, not automate	Fourth
Screening	First pass on inbound decks and intros; meet or pass	Strong: every past meet or pass decision is a label	● automate, measured	**First**
Due diligence	Data room, references, model, memo	Medium: memos exist, but judgment dominates	◑ assist the memo	Third
Monitoring	Founder updates, board decks, LP reporting	Strong once a KPI schema exists: history per company	◕ automate collection and flags	Second

THE RULE I APPLY

Automate where a decision already has a label. Assist where it does not. Never let the system act outside the fund without a person clicking.

WHAT THIS CHANGES FOR A LEAN TEAM

Partners keep the judgment calls. The system takes the first pass, the data chasing and the reporting, and shows its work every time.

Qualitative assessment from the role description and standard VC workflow; Harvey balls are my judgment, not measured data

One pipeline, four modules, and an evaluation layer that scores every automated decision against a partner's

DEAL FLOW

Intake	Extraction	Screening score	Partner queue	CRM
inbox, forms, Affinity or Notion	deck, site, registry, team	against the fund's written thesis	ranked, with reasons	one record, one status

PORTFOLIO

Founder update	KPI schema	Anomaly flags	Benchmarks	LP reporting
monthly, one form	same fields for every company	runway, growth, burn multiple	percentiles across the portfolio	quarterly letter, drafted

EVALUATION LAYER, UNDERNEATH BOTH

Logged: every score with its inputs and its reason, so a partner can audit any decision in one click.

Measured: weekly precision and recall against what partners actually decided, minutes per deal, drift over time.

Bounded: no outreach, no archive, no message to a founder or an LP without a person clicking.

Tools shown are examples; the system is built inside the fund's existing stack and stays the fund's property

The screening score is your published thesis written as criteria; every score arrives with its evidence and its gaps, and a partner still decides

CRITERIA, TAKEN FROM PROFOUNDERSCAPITAL.COM

CRITERION	EVIDENCE THE SYSTEM LOOKS FOR
Fixes a broken customer experience	Problem statement in deck and site; who pays, who suffers today
Working product	Live app, store listing, screenshots, docs, changelog
Early validation	Paying accounts, retention or usage figures, named customers
European HQ or significant presence	Registry, team locations, commercial footprint
Tech-enabled B2B or B2C model	Business model, software share of the value delivered
Stage and ticket fit, €500k to €3m	Round size, lead or syndicate, prior investors

PARTNER QUEUE, MONDAY 8:00 (SYNTHETIC EXAMPLES)

Nordic B2B, scheduling and invoicing for hourly staffing — **84**

Meets: broken CX, working product, EU HQ, B2B, ticket fit — meet

Gap: 40 paying accounts cited, no retention data. Ask before the call.

French B2C, second hand furniture logistics — **61**

Meets: broken CX, EU HQ, B2C. Gap: pre-product, waitlist only — pass, keep warm

Revisit trigger: first 100 paying orders.

US B2B analytics, no European presence — **22**

Outside geography and stage. Reason on file, one click to override. — pass

The queue orders and explains. The partner decides. Every override becomes a training example.

Synthetic deals, not real companies; criteria quoted or paraphrased from the fund's website; weights set with a partner in week one

One inbound deal, Monday 8:00: from inbox to a partner decision in six minutes, every step logged, nothing sent without a person

1 INTAKE

From: founder@nordic-shifts.example · 07:58

Intro: scheduling and invoicing for hourly staffing (Nordics)

deck.pdf | website | company registry

Extracted 08:00:41 · 43 s · one record created in the CRM

Company	**Nordic Shifts, Oslo**
Model	**B2B SaaS, workforce ops**
Product	**Live app, 3 store releases**
Traction	**40 paying accounts**
Round	**€1.5m seed, lead open**

2 SCREENING SCORE

- ✓ **Broken customer experience** — manual rosters, invoices late
- ✓ **Working product** — app live, changelog
- ? **Early validation** — 40 accounts, no retention data
- ✓ **European HQ** — Oslo, registry
- ✓ **Tech-enabled B2B** — software is the product
- ✓ **Ticket fit, €500k to €3m** — €1.5m seed

84 score against the written thesis
reasons attached, 5 of 6 met

Gap flagged: no retention data. Ask before the call.

3 PARTNER QUEUE AND DECISION

84	**Nordic Shifts**	5 of 6 met · 1 gap · meet
61	**French B2C furniture logistics**	pre-product · keep warm
22	**US B2B analytics**	outside geography · pass

Meet | Keep warm | Pass

MEET · decided by a partner · 08:04

Draft reply to founder prepared with the two questions from the gap

Held. Nothing leaves the fund until a person clicks send.

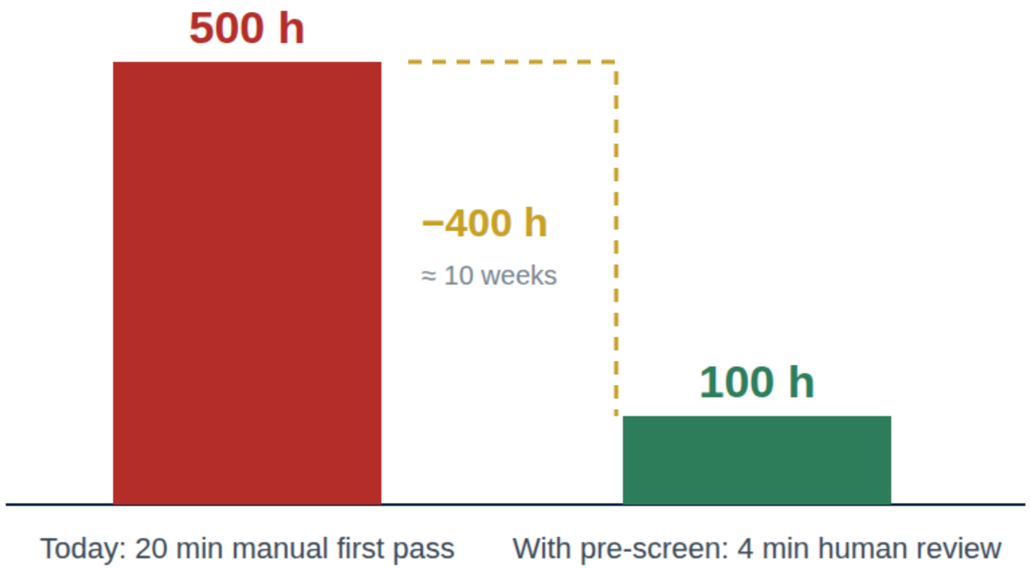

```
08:00:41  intake · deal_1043 · 3 sources · record created · cost €0.01
08:01:12  score · 84 · 5 reasons · 1 gap · thesis v3 · cost €0.04
08:04:30  decision · MEET · partner · agrees with score · added to gold set
08:04:31  outbound · draft only · no external action · invariant OK
```

Friday read-out · precision 64 % · recall 88 % · 4.2 min per deal · 0 external actions

Synthetic deal and log, illustrative timings; the flow is the one on slides 4 and 5, shown once end to end

Illustrative: a pre-screen that takes one machine minute per deal returns about 400 analyst hours a year at 1,500 inbound deals

HOURS PER YEAR ON THE FIRST PASS, ILLUSTRATIVE

WHAT THE HOURS DO NOT CAPTURE

CONSISTENCY

The same thesis applied on a Friday evening and a Monday morning; every pass with a reason on file.

MISSES

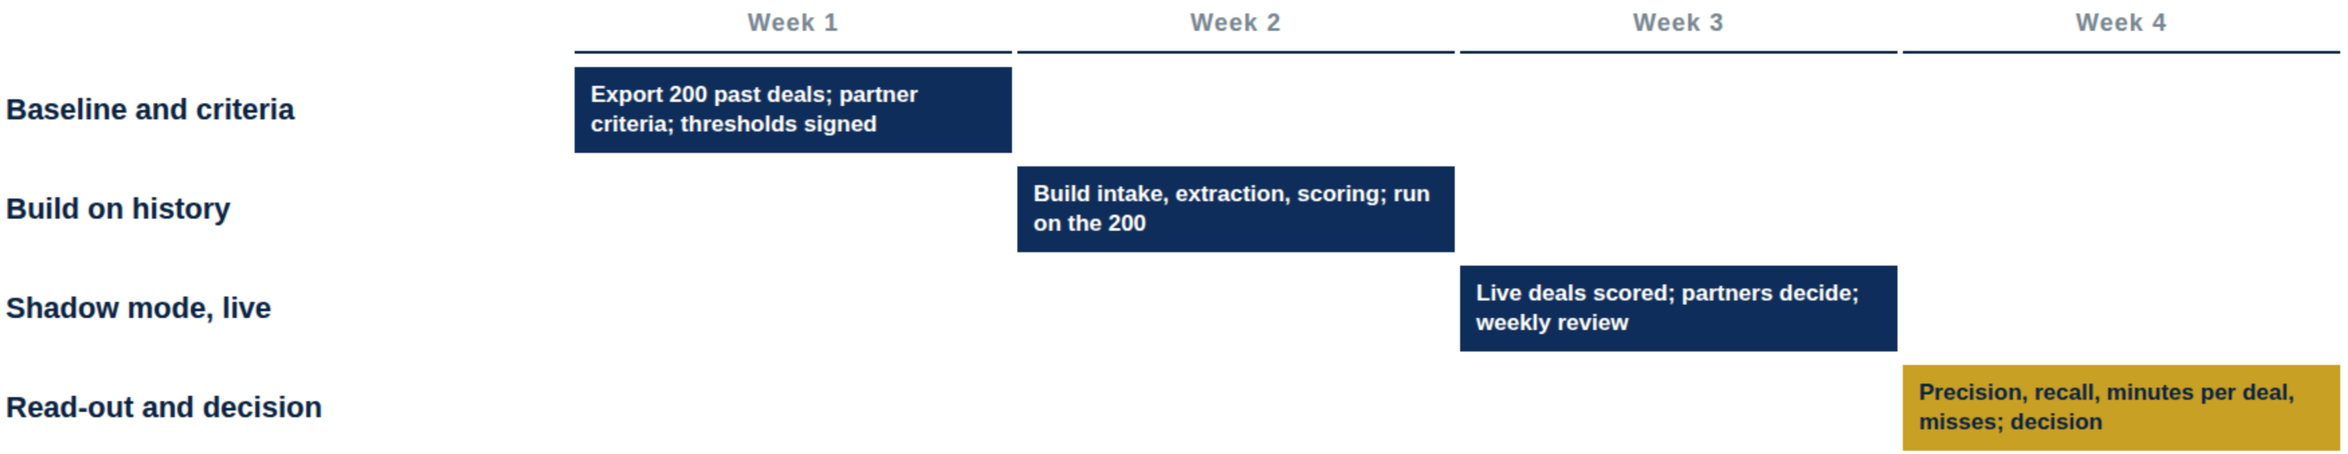

The deal nobody had time to open. Unmeasured today; the pilot measures it against your own past decisions.

REPORTING

The LP letter drafted from the same KPI table the team already reads. That is the second module, not a promise.

Illustrative assumptions, not PROfounders data: 1,500 inbound per year; 20 minutes manual first pass; 1 machine minute plus 4 minutes human review after pre-screen; 2,000 hour analyst year. Replaced by your numbers in week one.

A thirty day pilot on screening, scored against the last two hundred decisions you already made, with a stop rule

THRESHOLDS, SET IN WEEK 1

- Recall on "took a meeting": 85 % or more
- Time per deal, review included: 5 minutes or less
- Automated external actions: zero

STOP RULE

If recall is below the threshold on day 30, we stop. You keep the labeled dataset, the system as built and the report.

WHAT YOU GET EITHER WAY

- A labeled screening set, yours
- The pipeline inside your tools
- A written read-out a partner can challenge

Thresholds are illustrative and become binding only once signed with a partner in week one

Built inside your stack, keys in your name, yours at handover: three ways to run it, one I recommend, and a cadence you can set your watch by

A · IN YOUR STACK, I ADMINISTER (RECOMMENDED)

Your Google Workspace, your CRM, your repo. Accounts and API keys created in your name, on the kickoff call. You can revoke my access any day and nothing stops working.

B · FULLY MANAGED BY ME

Fastest to start, your deal data on my instance. Fine for a demo, not for an FCA regulated fund. I would not recommend it beyond week two.

C · HANDOVER

After any module: test and production copies, JSON backups, a six minute Loom, a one page map, support terms written down. Nothing depends on me being there.

HOW THE WORK RUNS

Kickoff, 30 min	Friday Loom, 6 min	Check-in, 20 min	Your test week	Definition of done
acceptance criteria, access, risks	delivered, blocked, decisions	every two weeks, near a milestone	real cases, edge cases, sign-off	written before the build, signed at the end

THEN, MODULE BY MODULE, EACH WITH ITS OWN READ-OUT AND GO OR NO-GO

	M1	M2	M3	M4	M5	M6
Modules	**Screening pilot**	**Portfolio monitoring**	**Benchmarks, LP letter**	**Diligence memo assist**	**Sourcing signals**	**Fund ops, audits**

Everything built for the fund belongs to the fund at deployment; generic patterns stay mine. Data stays in your tenant. Usage costs are billed to your accounts, never re-invoiced.

Production ready means it fails loudly, safely and traceably, and it is measured every Friday; this is the part I would want to be judged on

NEVER HAPPENS, WRITTEN BEFORE THE BUILD

- No message to a founder or an LP
- No deal rejected or archived without a person
- No data leaves the fund's tenant
- No score without a logged reason
- No criteria change without a partner's sign-off

WHEN IT BREAKS

- Retries, then a fallback model, then a stop; never a silent skip
- Minor failures routed to me, major ones to a partner within the hour
- One log per run: inputs, output, reason, cost
- Test and production separated; nothing ships untested

HOW IT STAYS GOOD

- A gold set of 200 labeled deals, yours, extended every month
- Precision and recall every Friday, alarm when they drift
- Any model change is an A/B on the gold set, decided with the numbers on the table
- Nothing "self-learns" in the dark

FRIDAY READ-OUT, WEEK 3 OF THE PILOT (SYNTHETIC EXAMPLE OF THE PAGE A PARTNER GETS)

METRIC	BAR, SET WEEK 1	WEEK 2, ON THE 200	WEEK 3, LIVE SHADOW	STATUS	WHAT HAPPENS NEXT
Recall on "took a meeting"	85 % or more	88 %	86 %	**On bar**	Two misses go to the Friday review
Precision on "meet"	60 % or more	64 %	58 %	**Watch**	Three cases reviewed with a partner
Minutes per deal, human review included	5 or less	4.2	4.6	**On bar**	Nothing
Automated external actions	0	0	0	**On bar**	A single one would stop the pilot
Runs failed loudly / silently	any / 0	2 / 0	1 / 0	**On bar**	Logged, retried, one re-run by hand

Most abandoned tools die of silence: nobody knows they stopped working. This one cannot fail quietly, and it cannot drift quietly either.

Read-out numbers are synthetic; same design as my open source execution harness (invariants, rollback, audit log), applied to a fund's workflow

Module two: twenty six active companies in ten countries, one monthly form, one KPI schema; updates become flags, benchmarks and the LP letter

KPI, MONTHLY	WHY IT MATTERS AT SEED	SOURCE	FLAG (ILLUSTRATIVE)
ARR or MRR growth, month on month	Trajectory against the plan agreed at investment	Founder update	Below plan two months running
Net burn and runway, months	Time to the next round or to profitability	Update, bank statement	Runway under 12 months
Gross margin	Whether growth is worth funding	Management accounts	Falling two quarters
Net revenue retention, cohort retention	Product pull, before any sales effort	Product or billing data	NRR under 100 %
CAC payback, months	Efficiency of the go-to-market	Update	Over 18 months
Burn multiple, net burn over net new ARR	Capital efficiency in one number	Computed	Over 2.0x

Same fields every month, anomalies flagged the day the update lands, percentiles across the portfolio, and the quarterly letter drafted from the same table.

Portfolio count from profounderscapital.com; KPI definitions are standard growth-stage practice; thresholds illustrative, set with the partners per company and stage

Why me: I have sat on the screening side of six funds, I build the system myself, and I measure before I automate

Roland-Caryl Obam
Freelance AI engineer, Paris
MSc AI for Business, from March 2027

UNIVERSITY OF OXFORD | Saïd Business School

DONE

- Technical scout and venture analyst for six early stage funds, 2022 to 2024: 25+ startups pre-scoped, contribution to a $2M seed round
- Two paid AI engagements in 2026, for a SaaS and an investor backed company
- Published an open source verifiable execution harness: invariants, rollback, audit log
- Advisor on LLM evaluations at a YC company, financial workflows

WHAT IT MEANS HERE

- I build systems, not only analyses
- I know what a first pass feels like at 11 pm with forty decks open
- Every automation ships with its evaluation, or it does not ship
- Comfortable chasing founders for numbers, politely and on time

FACTS

- University of Oxford, Undergraduate Advanced Diploma in IT Systems Analysis and Design, 2026, distinction
- Available immediately; Paris based, London compatible, remote fluent
- English working language, French native
- Passion outside work: basketball, since I was a teenager

Judge me on the pilot read-out, not on this slide.

Institution marks shown as the candidate's student affiliation, not as an endorsement

Next step: thirty minutes with a partner, one export, and a paid thirty day pilot that ends in a number

WHAT I AM ASKING

Introductory call	How a deal moves from inbox to partner meeting today; thirty minutes
One export	The last 200 inbound deals with their outcome, or whatever exists
Pilot	Thirty days, paid, scoped as on slide 8, with the stop rule
After the read-out	The role, a retainer, or nothing; decided on the number, not on this deck
